

AUTO ALARM RECEIVER AA 1212

The AA 1212 auto alarm receiver is designed for world wide seagoing vessels as well as for ashore radiostations. Its technical data conform to requirements of MPT 1204 and 1211 standards. The AA 1212 enables automatic receiving of the international alarm signal and signalling that it has been received. A receiving part of the device guarantees reception of A1A, A2A and H2A emissions as well as possibility of watchkeeping control of A2A and H2A signals by headphones and/or loudspeaker. Automatic gain control enables receiving of alarm signals at background noise. The auto alarm is an obligatory element of radiocommunication equipment on the 1st and the 2nd class ships if watchkeeping duty on the international distress frequency is not provided. All units of the AA 1212 have been mounted on printed boards. The AA 1212 is designed for installation in a radiostation console or may be delivered in cabinet version when requested. It is supplied from mains 110/220 V AC and alarm signalling circuits from reserve storage battery 24 V DC.
